

Permacon Textures

Unzip the Permacon Texture Library .zip file into a new folder titled "Permacon Textures" under "My Documents" or into an appropriate folder near the root folder.

Example: C:\Users\USER_NAME\Documents\Permacon Textures

Note that to avoid any issues, we recommend a tree structure of less than 256 characters including the file name.

The files include first and/or second generation textures. For an efficient and optimal use, here are some explanations illustrating the difference between these two versions. Please note that each texture file has its equivalent designed specifically for Sketchup.

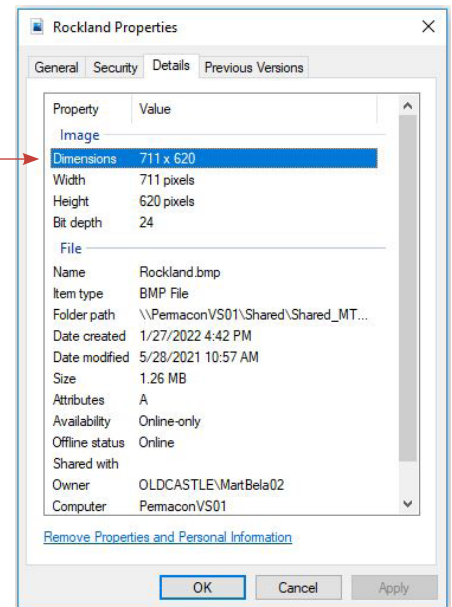

FIRST GENERATION TEXTURES

Product folders contain seamless textures in .BMP file format saved under their color names.

 Amber-Ambré	5/28/2021 10:57 AM	BMP File	1,284 KB
 Rockland	5/28/2021 10:57 AM	BMP File	1,294 KB
 Scandina	5/28/2021 10:57 AM	BMP File	1,282 KB
 Shaded-Ombragé	5/28/2021 10:57 AM	BMP File	1,287 KB

To quickly estimate the height and width for creating rendering materials, multiply the texture size in pixels by 7.375 to determine the product texture size in inches.

The product folder also contains a sub-folder of "tablets" in .BMP file format. These are 450 x 300 pixels in size and can be used to document your technical and business presentations. They all have the same size/scale and are only available for 1st generation textures.

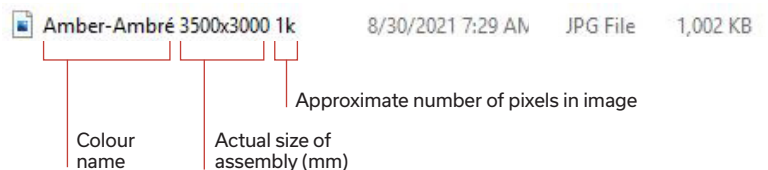

SECOND GENERATION TEXTURES

Product folders contain seamless textures in .JPG file format saved under their color names, the size of the assembly, and the pixel quality of the texture (1 or 2K).

Download the "Texture List" in .PDF format from the Support page¹

This downloadable guide features the textures of our products and will help you select the desired products.

The Permacon team is happy to share this texture library with you. We hope that this state-of-the-art tool will help you take your presentations to the next level.
